

THE POSSIBILITIES START HERE

Welcome to OpenDoc.

A local place to make documents you are proud to share.

Bring your idea and material. Work with your preferred agent to develop the writing and design. OpenDoc turns that work into a PDF you can read, refine, and make your own.

This document is the demonstration: real type, real layouts, real images, and the same PDF you can export.

Give good work a home.

Start with a reader, a purpose, and the material you already have.

Give your work a home

Every document belongs to a project.

Use the + beside Projects to create a home for a client, a course, or a body of work. Choose a default theme when you want new documents to start consistently.

Give your agent a brief

Name the reader, the purpose, and the material you want to use.

Create document gives you a prompt with your project included. Paste it into your coding agent and add your brief. As the agent changes the local source, OpenDoc refreshes the PDF.

A brief you can use

Write a two-page proposal from my notes. Explain the work and the next decision; flag missing prices. Keep the writing direct. Review every PDF page before handing it back.

Choose a starting point

Templates supply a page structure. Themes supply its visual character.

Browse real PDF specimens in Templates and Themes. Use this template starts from a layout you like. View AGENTS.md explains how your agent can adapt it. A custom composition is always possible.

Find your way around

Documents shows all your work; a project shows just its own documents. Search by name and switch between gallery and list views. Choose light, dark, or system appearance for the app.

The document menu lets you rename, duplicate, move, or delete a document. Deletion offers Undo. Renaming its library entry leaves the authored PDF title unchanged.

App appearance changes the workspace. Your document keeps its own page colors, typography, and artwork. [\[1\]](#)

Ideas taking form.

A picture can carry a mood, explain a process, or give an idea a physical presence.

Ideas taking form. An AI-generated editorial illustration made with Imagegen for this guide. The imagined paper sculpture is an illustration, not documentary evidence.

Give the image a job

Ask your agent for an image that serves the document. Describe the subject, composition, atmosphere, and space it needs on the page.

Keep the story with it

This image lives in the document's Media folder with a title, description, alternative text, attribution, and its original prompt. Open Media & Assets to inspect it.

03 / EXPLAIN

Let the evidence lead.

A fictional studio, 24 documents, 12 weeks: one dataset and three coordinated views.

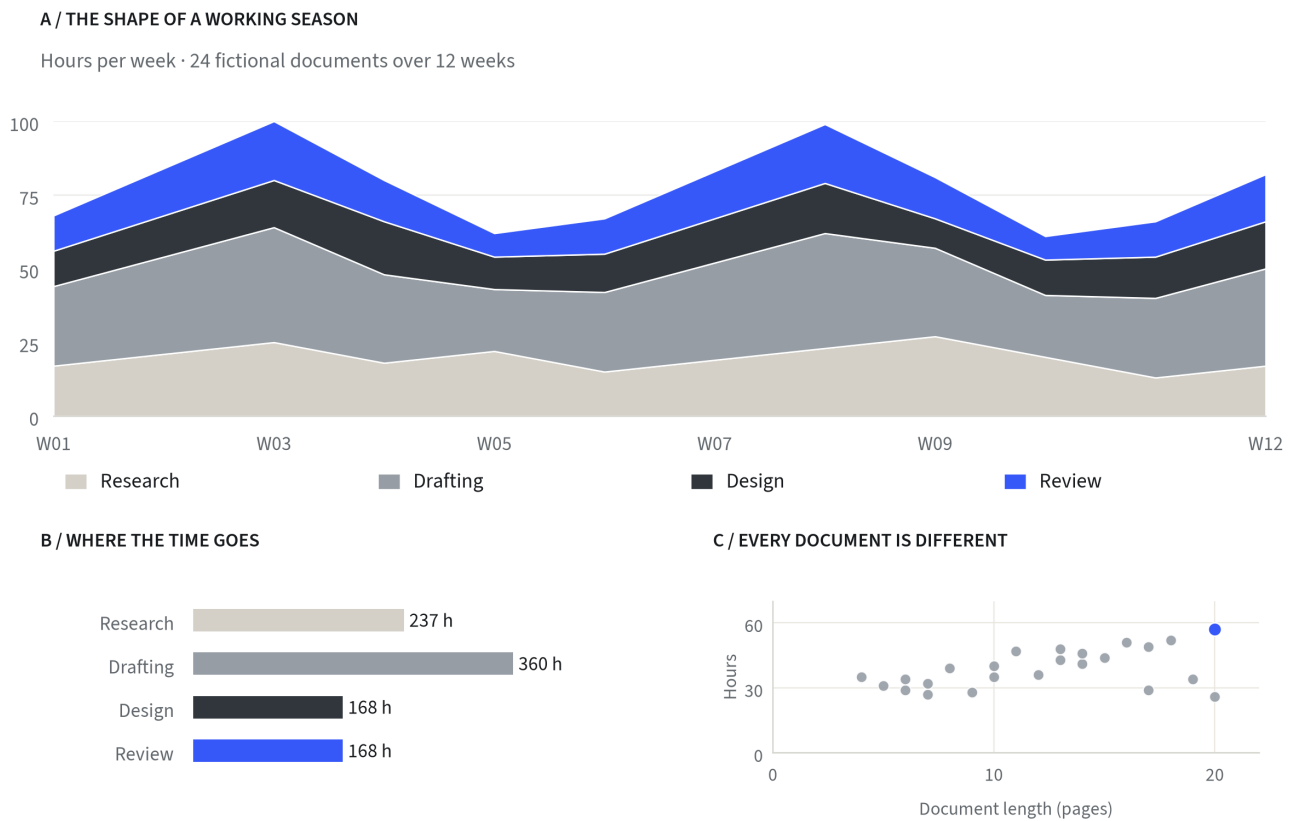

Figure 1. Weekly effort, workstream totals, and document length against effort.

Synthetic values, not a productivity benchmark. Each dot is a fictional document; blue highlights one example.

Table 1. The key values, as selectable text

Workstream	Hours	Share
Research	237	25.4%
Drafting	360	38.6%
Design	168	18.0%
Review	168	18.0%

Illustrative total: 933 hours. Prepared data, plot recipe, and a vector original are saved with the chart.

A page can change its pace.

A clear grid gives you freedom to vary the reading experience.

TWO VOICES

Aa

Sans for a clear, direct voice.

Aa

Serif italic for a reflective passage.

Make the reading path clear

This page uses an asymmetric one-to-two grid. The narrow column introduces the type; the wider column carries the explanation. Earlier pages use equal columns. The image page gives almost the whole width to one visual.

Use **weight** to establish hierarchy and *italic* for a change of voice. Let long paragraphs and tables continue naturally. Short independent pieces can sit beside one another without forcing an entire report into a fixed page count.

References can stay connected as the document changes. [Figure 1](#) and [Table 1](#) resolve from stable labels, rather than manually typed numbers. [\[2\]](#) [\[note 1\]](#)

A document can be rigorous and still feel alive.

Original OpenDoc house copy

Table 2. Choose a structure that serves the material

Composition	Useful for
One reading column	A sustained argument, essay, or long report
Two equal columns	Parallel ideas, paired explanations, or a concise comparison
A one-to-two split	A marginal note beside the main argument

A home for every asset.

Reusable identity and document-specific evidence belong together in the workspace.

OpenDoc

The existing OpenDoc wordmark, imported into the shared Logos library and bound to this document. This dark artwork is placed on a light page.

Share the identity

Import reusable logos and fonts once.

Add named logo variations with guidance for the surfaces they suit. Import original static font faces and inspect the real PDF specimen before choosing them for a document.

Theme defaults help new documents start consistently. Each document keeps its saved asset choices until you explicitly update them. A newer logo or font version does not silently replace the one in this PDF.

Keep the evidence local

Images and charts belong to their document. Keep prepared data, recipes, and attribution beside each visual. Original references can stay wherever you already manage them.

Search Media by title, kind, or document. Its detail view shows where an image is used, its prepared files, and its source notes. Ask the agent to regenerate a chart when the underlying data changes.

OpenDoc detects changes to recorded visual inputs. A derived image must be regenerated, reviewed, and recorded before the revised document can export. [\[3\]](#)

Table 3. What travels with this chart

Prepared file	Why it matters
Editable data	The 24 records behind the figure
Plot recipe	A reproducible way to draw the same comparison
Image + vector original	A reviewed PDF image and an editable visual source

The next draft is yours.

Read, notice, revise

Review the PDF as your reader will encounter it.

Use page thumbnails, the outline, and zoom. Select text or a component to inspect it. Check the argument, the figures, and the final page; accurate facts and useful sources still need your judgment.

Choose Edit or Comment from the selection controls. Make several wording corrections, use Undo or Redo, then Save all. The bottom-right comments button opens saved feedback.

For the curious: a real, editable paragraph starts simply / tsx

```
<Paragraph id="my-opening">
  Begin with the idea you want to share.
</Paragraph>
```

Your coding agent works in TSX with native PDF components. You can direct the writing and design in ordinary language.

The local guides behind this tour

[1] OpenDoc. Workspace guide. Local file: README.md (2026).

[3] OpenDoc. Media & Assets. Local files: docs/ASSETS.md and docs/MEDIA.md (2026).

About the demonstration

[note 1] The chart data and studio examples in this guide are synthetic. The paper sculpture was AI-generated. The guide's quotations are original OpenDoc copy.

Try a small correction

This sentence is ready for your first edit.

Select the sentence above and change a word. Use comments for work that needs the agent's judgment: rewriting a passage, checking a source, or improving a layout. Ask the agent to apply the saved feedback.

Saved corrections reach the local source. Comments retain their history. Formatting, structure, and calculations remain agent work.

Made here. Ready to share.

Export the version you have read, checked, and made your own.

Export the version you reviewed

Save pending text corrections and review the updated PDF first.

Choose Export, name the file, and select Save PDF. OpenDoc saves it in the workspace's output folder. Download a copy lets the browser save another copy; open the PDF to print, reveal it in your files, or copy the PDF file on macOS.

Keep the versions

Previous exports keeps the files you saved. Open, reveal, or remove a saved export with Undo. A later edit to the document does not change an earlier PDF.

Wait for a ready revision

If a revision fails to render, the last successful preview stays visible with an error. Fix the current revision before exporting it.

Your source, assets, feedback, and PDFs stay local. OpenDoc has no built-in AI chat; you choose the external agent and what you share with it. Keep the workspace in your backup routine or version control.

Now bring an idea worth putting on a page.
